In this post, I am going to discuss how Python is being used in the field of bioinformatics and how you can use it to analyze sequences of DNA, RNA, and proteins. Yeah, Python is being used by biologists as well. Before I get into coding, I'd like to give a brief background of bioinformatics and

In this article, a simple python script is provided that can be used to search for a specific character in a file. If you have a file consisting of some information including name, address, email, post, and so on. You want to extract only email addresses present in that file, then use the following script/block of code.

One goal of this book is to help significantly expand Python's use for bioinformatics programming. Python features a syntax in which the ends of statements are marked only by the end of a line, and statements that form part of a compound statement are indented relative to the lines of code that introduce them. The semicolons or keywords that end statements and the braces that group statements in other languages are entirely absent.
