Widely considered the optimal electrocardiography reference for practicing physicians, and consistently rated as the best choice on the subject for board preparation, this is an ideal source for mastering the fundamental principles and clinical applications of ECG. The 6th edition captures all of the latest knowledge in the field, including expanded and updated discussions of pediatric rhythm problems, pacemakers, stress testing, implantable cardioverter-defibrillator devices, and much more. It's the perfect book to turn to for clear and clinically relevant guidance on all of today's ECG applications. Comprehensively and expertly describes how to capture and interpret all normal and abnormal ECG findings in adults and children. Features the expertise of internationally recognized authorities on electrocardiography, for advanced assistance in mastering the subtle but critical nuances of this complex diagnostic modality. Features new chapters on pediatric electrocardiography that explore rhythm problems associated with pediatric obesity, heart failure, and athletic activity. Presents a new chapter on recording and interpreting heart rhythms in patients with pacemakers. Includes new material on interpreting ECG findings associated with implantable cardioverter-defibrillators. Provides fully updated coverage on the increased importance of ECGs in stress testing.

This book discusses the most important practical aspects involved in providing multidisciplinary Adolescent and Young Adult (AYA) services for cancer patients. It draws on international experience in several continents of establishing and running such services and provides a contemporary, practical approach to AYA care based on accumulated experience. It is of interest to those establishing or seeking to improve AYA services as well as those already caring for AYA cancer patients. Among topics discussed are incidence trends and treatment pathways, access to clinical trials for adolescents, transition from pediatric to adult services, psychological support and social care as well as survivorship and fertility. This book is of value of those establishing new services, those developing an existing service and those whose work includes the care of AYA patients. It is an important companion for pediatricians, oncologists as well as other medical, nursing and allied health professionals caring for Adolescents and Young Adults with cancer.

The aim of the American Psychiatric Association Practice Guideline series is to improve patient care. Guidelines provide a comprehensive synthesis of all available information relevant to the clinical topic. Practice guidelines can be vehicles for educating psychiatrists, other medical and mental health professionals, and the general public about appropriate and inappropriate treatments. The series also will identify those areas in which critical information is lacking and in which research could be expected to improve clinical decisions. The Practice Guidelines are also designed to help those charged with overseeing the utilization and reimbursement of psychiatric services to develop more scientifically based and clinically sensitive criteria.

Nearly one-half of an American woman's life is spent after the cessation of reproductive function. A woman of 40 years has an additional life expectancy of nearly 40 years; a woman of 75, over 11 years. This pattern of longevity is likely to continue, so that by the year 2000, it has been estimated, 30 percent of the female population will be postmenopausal. While it is difficult to separate the results of aging from those of estrogen deprivation, it is important that we try to do so, since the results of the latter are amenable to treatment. The medical infirmities resulting from estrogen deprivation take a high toll among postmenopausal women. Nearly 200,000 hip fractures occur annually in this group, resulting in 15,000 deaths and a high morbidity rate. Sleep disorders, compromised sexuality, psychomotor alterations of the climacterium, and urinary tract disorders all contribute to a lowered quality of life. Appropriate treatment of these disturbing postmenopausal conditions requires an understanding of the underlying biochemical, endocrinologic, psychologic, and pathophysiologic alterations of estrogen deprivation. Toward this end, the reader will find herein chapters dealing with

estrogen metabolism in the postmenopausal female, end-organ response to estrogen deprivation, and bone metabolism and osteoporosis. Next, the reader will find chapters dealing with specific organs, organ systems, or conditions related to the quality of life; for example, sexuality, urinary tract problems, sleep disorders, the breast, sports and exercise, the climacteric, and the psychobiology of the menopause.

Hallucinations, a natural phenomenon as old as mankind, have a surprisingly wide range. They appear under the most diversified conditions, in the "normal" psyche as well as in severe chronic mental derangement. As a symptom, hallucinations are a potential part of a variety of pathological conditions in almost all kinds of psychotic behavior. In addition, lately, various psychological and sociological circumstances seem to favor widespread use and abuse of hallucinogens, substances able to produce hallucinations in the normal brain. They not rarely lead to serious psychopathology such as toxic, and mobilized or aggravated endogenous psychoses. While such development adds to our scientific knowledge, it also contributes to our current social troubles. Neurologists and neurosurgeons, psychiatrists, psychologists and other specialized researchers constantly have been dealing with the phenomenon, its roots and branches, and yet, its primary mechanisms are largely unknown. However, investigators of hallucinations now seem to enter common ground on which meaningful discussions and joint approaches become feasible and more promising. We have come a long way from the Latin term "hallucinari", meaning to talk nonsense, to be absent-minded, to the modern concept of "hallucinations". While the Latin word was descriptive of what may be due to hallucinations, the modern concept defines hallucinations as subjective experiences that are consequences of mental processes, sometimes fulfilling a purpose in the individual's mental life.
