BRAIN INSULT. Finally, in adult cardiac surgery, any brain insult will affect an organ that is presumed to have previously been normal and completely developed. A “static neuropsychological deficit” model

9 is thus applicable. A brain insult that occurs during infant cardiac surgery affects an organ that will, under normal circumstances, continue to undergo enormous change well into the second decade.

complications after pediatric cardiac surgery ranges from 2% to 25%. The causes are multifactorial and include preoperative brain malformations, perioperative hypoxemia and low cardiac output states, sequelae of cardiopulmonary bypass, and deep hypothermic circulatory arrest. Brain May Suffer Long After Heart Bypass

Abstract. Cardiac arrest is common and deadly. Most patients who are treated in the hospital after achieving return of spontaneous circulation still go on to die from the sequelae of anoxic brain injury. In this review, the authors provide an

The Brain after Cardiac Arrest

In addition to ischemia due to hypoperfusion and distal embolization, cardiac surgery elicits a systemic inflammatory response that may lead to a disruption of the blood-brain barrier (BBB) and neurological dysfunction. 9 In experimental models the use of

common during bypass surgery, and other studies using pre-and-post-operative MRI scans have shown tiny ischemic lesions (small strokes) in the brains of people who experience cognitive decline. However, even these studies have yielded mixed results, and the causative role of microemboli is not yet proven.
