Chemical Reaction Engineering: Fogler & Gurmen
A chemical reactor is an enclosed volume in which a chemical reaction takes place. In chemical engineering, it is generally understood to be a process vessel used to carry out a chemical reaction, which is one of the classic unit operations in chemical process analysis. The design of a chemical reactor deals with multiple aspects of chemical engineering.

Chemical reactions lie at the heart of processes where molecules are transformed from raw materials to useful products and energy. For the economic utilisation of such chemical transformations the unit where they are performed (the reactor) needs to be carefully designed accounting for kinetics, hydrodynamics, mass and heat transfer.
