Conclusion This experiment uses molecular models to clarify aspects related to stereoisomerism, a topic that is very important in the discussion of alkene chemistry. Molecular models are designed to reproduce molecular structures in three dimensions, allowing many subtle features concerning shapes of molecules (such as dipole moment, polarity, bond angle, symmetry, reaction stereochemistry) to become clearer.

In this lesson, we discuss how to build molecular models of organic compounds, including straight-chain, branched, and ring-shaped molecules with functional groups. Introduction to Molecular Models

Building Molecular Models of Organic Compounds | Study.com

During lab construct a molecular model, using the kit provided, for each species listed in the tables. Do not make models for species where resonance is important (e. g., species in Group B and Group E) because these models will mislead you into thinking that there are double and single bonds in these species where there are not.
