This text is a comprehensive examination of the economics of using natural resources in the modern economy. Presenting economic concepts essential to examining how resources can be sustained, extracted and harvested extensive use is made of diagrams and accompanying algebraic models. * NEW! This edition of the text features a new organization. The first section is an overview of techniques, the second focuses on static models of natural resource use, and the third examines dynamic models of natural resource use. * NEW! Revised and updated cases use real-world examples and show how they are linked to natural resource modeling. * NEW! Text pedagogy has been improved overall, including a much more extensive use of graphs. * Only current book solely on natural resources (without environmental econ) for all of North America. * The Second Edition stresses the economics of sustainability; continues thorough coverage of land and water use, fisheries, pollution policy, non-renewable resources, and forests. * Advanced chapters are included for use in honors/graduate courses: e.g., parts of Chapters 3, 9, 11, and 12.

Before the late 1980s, when the ideas of sustainability and sustainable development to the forefront of public debate, conventional, neo-classical economic thinking about development and growth had rarely given any consideration to the needs of future generations, or the sustainability of natural resource use. Defining sustainability broadly as intergenerational fairness in the long-term decision making of a whole society, and using established economic concepts, this selection of refereed journal articles brings a famously ill-defined concept into sharp focus, providing academics at all levels with a formidable research tool. Spanning thirty years of the most important philosophical, theoretical and empirical contributions from both critics and defenders of neo-classical assumptions and methods of economic analysis, this focused collection of papers constitutes a unique, balanced resource on the full range of intellectual debates surrounding the economics of sustainability.

Seminar paper from the year 2014 in the subject Economy - Environment economics, grade: 1,3, University of Trier, course: Environmental Economics, language: English, abstract: "Contemplation of the world's disappearing supplies of minerals, forests, and other exhaustible assets has led to demands for regulation of their exploitation. The feeling that these products are now too cheap for the good of future generations, that they are being selfishly exploited at too rapid a rate, and that in consequence of their excessive cheapness they are being produced and consumed wastefully has given rise to the conservation movement" (Hotelling 1931, 139). Already in 1931 Hotelling described aptly the problem concerning sustainable management of resources in order to ensure intergenerational equity. More than 80 years later the problem still has not been solved but a lot of work has been done in order to find a remedy. One major contributor is John Hartwick with his rule concerning how to keep consumption constant if the economy runs partially on exhaustible resources. This paper starts with a short introduction to three different concepts of sustainability. It continues to give an overview of relevant research prior to Hartwick. The main part consists of the original Hartwick rule which is discussed in some depth. In the following priority is given to adaptations to the rule done by Hartwick himself over those by other economists. Obviously, it is not possible to cover every work in this regard. Rather, the work chosen tackles those aspects that are viewed most critically and were fairly close in time to release to the original Hartwick rule.

Concerns about sustainability have brought environmental economics to the foreground. These volumes are particularly concerned with issues relating to the long-term depletion of non-renewable resources.

Considers the role of economics in discussions about the depletion of finite stocks of natural resources including oil.

An introduction to the concepts and tools of natural resource economics, including dynamic models, market failures, and institutional remedies. This introduction to natural resource economics treats resources as a type of capital; their management is an investment problem requiring forward-looking behavior within a dynamic setting. Market failures are widespread, often associated with incomplete or nonexistent property rights, complicated by policy failures. The book covers standard resource economics topics, including both the Hotelling model for nonrenewable resources and models for renewable resources. The book also includes some topics in environmental economics that overlap with natural resource economics, including climate change. The text emphasizes skills and intuition needed to think about dynamic models and institutional remedies in the presence of both market and policy failures. It presents the nuts and bolts of resource economics as applied to nonrenewable resources, including the

two-period model, stock-dependent costs, and resource scarcity. The chapters on renewable resources cover such topics as property rights as an alternative to regulation, the growth function, steady states, and maximum sustainable yield, using fisheries as a concrete setting. Other, less standard, topics covered include microeconomic issues such as arbitrage and the use of discounting; policy problems including the “Green Paradox”; foundations for policy analysis when market failures are important; and taxation. Appendixes offer reviews of the relevant mathematics. The book is suitable for use by upper-level undergraduates or, with the appendixes, masters-level courses.

The topics discussed in the Handbook on the Economics of Natural Resources are essential for those looking to understand how best to use and conserve the resources that form the foundation for human well-being. These include nonrenewable resources, mod

Forest resources are an ideal starting point for economic analysis of sustainability. In this book, leading economists discuss key aspects of sustainability and sustainable forest management including complexity, ethical issues, consumer choice theory, intergenerational equity, non-convexities, and multiple equilibria. This systematic critique of neoclassical economic approaches is followed by a companion work, *Institutions, Sustainability, and Natural Resources: Institutions for Sustainable Forest Management*, Volume 2 in the series.
