Increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for

One or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or

Condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

When you visit the doctor, information about you may be recorded in an office computer. Your tests may be

Your data may be collected by the state government or by an organization that accredits health care or studies medical costs. By making information more readily available to those who need it, greater use of computerized health information can help improve the quality of health care and reduce its costs. Yet health care organizations must find ways to ensure that electronic health information is not improperly divulged. Patient

This manual has been designed as a basic reference for use when exploring the development and implementation of electronic health record (EHR) systems. It provides a general overview, some basic definitions and examples of EHR practices. Also covered are points for consideration when moving towards the introduction of an EHR, some issues and challenges which may need to be addressed and some possible strategies, along with steps and activities to implementation. There is a particular focus on setting goals, revising policies, developing an action plan

and outlining implementation procedures.

When hospitals began implementing their electronic medical records/electronic health records systems (EMR/HER) the pharmaceutical companies that were conducting clinical trials at those hospitals wanted to sue the date from those systems instead of having the hospitals enter the data in their EHR systems and also in the study data entry system. However, the FDA regulations would require that the hospital systems be "validated". The hospitals and the companies developing

The systems argued that was "over-regulation." HIMSS published their Developer Code of Conduct where they said instead they would use Quality Management techniques. This book covers how to use Quality Management (ISO 9001) to develop computer systems, specifically EMR systems. It gives a basic introduction to how to implement computer systems. It also covers the topic of compliance because the hospitals are required to comply with regulations other than FDS regulations. The book also discusses the topics of risk management and conducting audits, both of which are part of ISO
