These solutions are the result of taking CS-520 (Advanced Graph Theory) course in the Jan-July semester of 2016 at Indian Institute of Technology Guwahati. This is not a complete set of solutions in that book. It may happen that solution of some problem may be wrong. I have not veri ed these problem from some expert.

INTRODUCTION TO GRAPH THEORY

Let 'G' be a connected planar graph with 20 vertices and the degree of each vertex is 3. Find the number of regions in the graph. Solution. By the sum of degrees theorem, $20 \sum \deg(v_i) = 2|E|$. $20(3) = 2|E|$. $|E| = 30$. By Euler's formula, $|V| + |R| = |E| + 2$.

All the graph theory books are isomorphic.* We will cover ten chapters. The grade will consist of: Homework (20%) 10 assignments. Each chapter will have its own homework; 5 problems for each chapter. Solutions will be posted afterwards. Two assignments will be dropped. Project (10%) Paired. Test (30%) Two tests, 15% each. Already on calendar.

Math 179: Graph Theory - Evan Chen

Graph (graph theory) In graph theory , a graph is a (usually finite) nonempty set of vertices that are joined by a number (possibly zero) of edges . Graphs are frequently represented graphically, with the vertices as points and the edges as smooth curves joining pairs of vertices.

Graph Theory Lecture Notes

The two discrete structures that we will cover are graphs and trees. A graph is a set of points, called nodes or vertices, which are interconnected by a set of lines called edges. The study of graphs, or graph theory is an important part of a number of disciplines in the fields of mathematics, engineering and computer science. What is a Graph?

Graph theory is also widely used in sociology as a way, for example, to measure actors' prestige or to explore rumor spreading, notably through the use of social network analysis software. Under the umbrella of social networks are many different types of graphs. Acquaintanceship and friendship graphs describe whether people know each other.

Solution: Let G be of a cycle on 6 vertices, and let G be the union of two disjoint cycles on 3 vertices each. In both graphs each vertex has degree 2, but the graphs are not isomorphic, since one is connected and the other is not. 3.A graph is k-regular if every vertex has degree k.

The graph $G[S] = (S; E_S)$ with $E_S = \{uv \in E : u, v \in S\}$ is called the subgraph induced (or spanned) by the set of vertices S . Graphs derived from a graph Consider a graph $G = (V; E)$. The complement of G , denoted by G_c , is the graph with set of vertices V and set of edges $E_c = \{uv \in V \times V : uv \notin E\}$. A graph isomorphic to its complement is called self-complementary.
