A Waterstones Paperback of the Year! What happens when you feel stressed? Maybe you start sweating, or your heart beats faster. When Charlie McGuffin gets stressed, something a little bit different happens: he turns into an animal! Unfortunately, things are getting quite stressful for Charlie: - His dad's business is in real trouble - He might have to move in with his Aunt Brenda and her seventeen cats (and wooden leg) - And it's getting harder and harder to control his powers Luckily, Charlie's best friends Flora, Wogan and Mohsen are on hand to help. If they can break into the fortress-like offices of Van Der Gruyne Industries and recover the McGuffins' stolen gold, maybe Charlie won't have to move away after all. Can Charlie's friends help him master his powers once and for all, or will he end up stuck as a pigeon forever? Praise for Charlie Changes into a Chicken: 'This is a really funny book!' Alice, age 8 'My body couldn't help but shake with laughter' Maren, age 10 'Belly-busting hilarity' The Guardian 'Laugh-out-loud funny' The Mail on Sunday 'The modern masterpiece . . . this savvy, comic tale ticks every box' The Daily Telegraph 'Cleverly daft storytelling at its very, very best' Maz Evans, author of 'Who Let The Gods Out?' 'The best kind of silly' The Observer 'Full of heart and humour, wit and wisdom' Sophie Anderson, author of 'The House with Chicken Legs' 'Wonderfully heart-warming and absolutely hilarious' Catherine Doyle, author of 'The Storm Keeper's Island' Charlie Changes into a Chicken has been: Shortlisted for the Waterstones Children's Book Prize! Longlisted for the Brandford Boase Award! Longlisted for the Blue Peter Award! The Guardian and The Telegraph's Book of the Year!

Electrical safety for Recreational Vehicle owners and technicians

A multicolor edition of Vol.II of A Textbook of Electrical Technology to keep pace with the ever-increasing scope of essential and modern technical information,the syllabi are frequently revised.This often result into compressing established facts to accommodate recent information in the syllabi.Fields of power-electronics and industrial power-conditioners have grown considerably resulting into changed priority of topics related to electrical machines.Switched reluctance-motors tend to threaten the most popular squirrel-cage induction motors due to their increased ruggedness,better performance including controllability and equal ease with which they suit rotary as well as linear-motion-applications.

A thermal probe penetrating a glacier requires heat at the hot point for melting as well as along its entire length to balance the radial heat dissipation in the ice and thus prevent freezing in. The heat transfer problem is solved with a LaPlace transform and the results are developed graphically to simplify the numerical calculations. A performance diagram, developed as a design and operating aid, serves for analysis of the anticipated penetration performance of the probe and the required power levels. (Author).

A Textbook of Electrical Technology(Vol. IV)Multicolorpictures have been added to enhance the contenten value and give to the students an idea of what he will be dealing in realityand to bridge the gap between theory and practice.A notable feature is the inclusion of chapter on Flip-Flops and related Devices as per latest development in the subject.Latest tutorial problems and objective type questions specially for GATE have been included at relevant places.

This book covers the essential topics for a second-level course in strength of materials or mechanics of materials, with an emphasis on techniques that are useful for mechanical design. Design typically involves an initial conceptual stage during which many options are considered. At this stage, quick approximate analytical methods are crucial in determining which of the initial proposals are feasible. The ideal would be to get within 30% with a few lines of calculation. The designer also needs to develop experience as to the kinds of features in the geometry or the loading that are most likely to lead to critical conditions. With this in mind, the author tries wherever possible to give a physical and even an intuitive interpretation to the problems under investigation. For example, students are encouraged to estimate the location of weak and strong bending axes and the resulting neutral axis of bending before performing calculations, and the author discusses ways of getting good accuracy with a simple one degree of freedom Rayleigh-Ritz approximation. Students are also encouraged to develop a feeling for structural deformation by performing simple experiments in their outside environment, such as estimating the radius to which an initially straight bar can be bent without producing permanent deformation, or convincing themselves of the dramatic difference between torsional and bending stiffness for a thin-walled open beam section by trying to bend and then twist a structural steel beam by hand-applied loads at one end. In choosing dimensions for mechanical components, designers will expect to be guided by criteria of minimum weight, which with elementary calculations, generally leads to a thin-walled structure as an optimal solution. This consideration motivates the emphasis on thin-walled structures, but also demands that students be introduced to the limits imposed by structural instability. Emphasis is also placed on the effect of manufacturing errors on such highly-designed structures - for example, the effect of load misalignment on a beam with a large ratio between principal stiffness and the large magnification of initial alignment or loading errors in a strut below, but not too far below the buckling load.
