General Anatomy. Basically expressed, human life structures is the investigation of the pieces of the human body. Human life systems incorporates both gross life structures and minute life structures. Net life structures incorporates those human structures that can be seen with the unaided eye. Net life systems can be contrasted with the structure of a house as appeared in a diagram of a house or by taking a gander at and examining a house face to face with the unaided eye.

Physiology focuses on the causes and effects of various bodily functions. Physiological content will often parallel the depth to which anatomical content was previously covered. For example, since Anatomy frequently focuses on nerves and muscles, Physiology often pays particular attention to these groups.

To support the general function of the nervous system, neurons must communicate within the cell (intracellular signaling) and between other cells (intercellular signaling). In order to achieve long distance and rapid communication, neurons have special abilities for sending electrical signals (action potentials) along axons.

Physiologists need to understand anatomy because the form and location of cells, tissues, and organs are related to function. In a combined course, anatomy tends to be covered first. If the courses are separate, anatomy may be a prerequisite for physiology. The study of physiology requires living specimens and tissues.
