"Maternal Adjustment to Premature Birth: Utilizing the Roy ... This article examines whether preterm newborns' behavior and their mother's adjustment to the premature birth and infant hospitalization have an influence on subsequent infant development and behavior, maternal adjustment, and mother-infant relationship. The behavioral competencies of 42 well, singleton preterm infants (mean gestational age=31 weeks) were assessed, as were their mothers' adjustment (depression and coping) and competencies (knowledge of child development).

Maternal stress during pregnancy was more common among women who delivered preterm ( $p < 0.000$ ) compared to the control group and was still evident after adjusting for premature contractions, tobacco use, previous preterm delivery and genital tract infection (Table 4). The difference also remained in the multiple logistic regressions with the same adjustment after excluding the 24 cases of twin pregnancies from the total study population.

assessment did not attenuate the association between preterm birth and SBP (3.99 [0.82, 7.16] mmHg; Table 2 Model 2). Accounting for hypertensive disorders of pregnancy (Model 3) attenuated the estimate for SBP by approximately 30% to 2.78 (-0.30, 5.87) mmHg, while the estimate for HDL was only slightly attenuated (-6.67 [-12.13, -1.20] mg/dL).

complex public health problem that requires multifaceted solutions. Preterm birth is a cluster of problems with a set of overlapping factors of influence. Its causes may include individual-level behavioral and psychosocial factors, sociodemographic and neighborhood characteristics, environmental exposure, medical conditions, infertility treatments, and biological factors. Many of these factors co-occur, particularly in those who are socioeconomically disadvantaged or who are members of racial and ethnic minority groups. While advances in perinatal and neonatal care have improved survival for preterm infants, those infants who do survive have a greater risk than infants born at term for developmental disabilities, health problems, and poor growth. The birth of a preterm infant can also bring considerable emotional and economic costs to families and have implications for public-sector services, such as health insurance, educational, and other social support systems. Preterm Birth assesses the problem with respect to both its causes and outcomes. This book addresses the need for research involving clinical, basic, behavioral, and social science disciplines. By defining and addressing the health and economic consequences of premature birth, this book will be of particular interest to health care professionals, public health officials, policy makers, professional associations and clinical, basic, behavioral, and social science researchers.

Influence of Pregnancy Weight on Maternal and Child Health: Workshop Report summarizes a one and a half day workshop convened in May 2006 that reviewed U.S. trends in maternal weight (prior to, during, and after pregnancy) among different populations of women; examined the emerging research findings related to the complex relationship of the biological, behavioral, psychological, and social interactions that affect maternal and pregnancy weight on maternal and child health outcomes; and discussed interventions that use this complex relationship to promote appropriate weight during pregnancy and postpartum. Given the unprecedented environment in the United States

in which two-thirds of the adult population meets the criteria for being overweight or obese, the implications for women in the reproductive age period are unique in the history of the country. The concerns for maternal and infant health are real. The questions and answers tackled by committee members and workshop participants were not easy. Nevertheless, having an opportunity to explore what is known, examine the gaps in knowledge, and explore what to do now and in the future build a pathway for further inquiry and action. This report summarizes the workshop proceedings and highlights key themes that deserve further attention. The participants in this workshop describe what is known about recent trends in maternal weight gain and the impact of maternal weight during pregnancy on the health of mothers and their children. The workshop provided a valuable opportunity to assess trends that have occurred since the publication of an earlier study by the Institute of Medicine (IOM), which included guidelines for recommended weight gain during pregnancy.

Each year in the United States approximately 440,000 babies are born premature. These infants are at greater risk of death, and are more likely to suffer lifelong medical complications than full-term infants. Clinicians and researchers have made vast improvements in treating preterm birth; however, little success has been attained in

understanding and preventing preterm birth. Understanding the complexity of interactions underlying preterm birth will be needed if further gains in outcomes are expected. The Institute of Medicine's Roundtable on Environmental Health Sciences, Research, and Medicine sponsored a workshop to understand the biological mechanism of normal labor and delivery, and how environmental influences, as broadly defined, can interact with the processes of normal pregnancy to result in preterm birth. This report is a summary of the main themes presented by the speakers and participants.

Worldwide, more than 1 million infants die as a result of premature birth. In the United States, where 1 in 10 births occurs preterm, premature birth is the leading cause of infant mortality. Premature infants have high rates of mortality and morbidity, with the highest rates seen in those infants born extremely preterm—prior to 30 weeks gestation. Severe morbidity in these infants often contributes to life-long health problems. Maternal hypertension (HTN) is one contributor to preterm birth and also contributes to fetal growth restriction, resulting in birth weights which are small for gestational age (SGA, and generally within the lowest 10th percentile). Within this high risk population, SGA infants have increased risk of mortality compared to appropriate for gestational age infants. Therefore the impact of

maternal HTN on neonatal outcome might be presumed to be negative. Previous studies however, have been contradictory, with both higher and lower rates of infant mortality reported in infants born to mothers with HTN, as well as differing reports analyzing the relationship between serious morbidity and maternal HTN. Utilizing the Vermont Oxford Network Very Low Birth Weight database, a collaborative database of Level III Neonatal Intensive Care Units across the world, 88,275 North American infants born between 22+0 and 29+6 weeks gestational age between 2008 and 2011 were identified. This dissertation explores the relationship between maternal HTN and gestational age at time of birth within this population, and the reported rates of morbidity and mortality in infants born prior to 30 weeks gestation. The independent contributions of maternal HTN with neonatal morbidity and mortality in our population were estimated using logistic regression and adjusting for factors previously known to be associated with risk, including birth weight, antenatal steroid exposure, infant sex, maternal race/ethnicity, prenatal care, inborn/outborn status, and birth year. We hypothesized that mortality rates would be lower for infants born to mothers with HTN compared to those born due to other factors, when corrected for the noted confounding variables and surviving infants would have better prognoses, as evidenced by lower rates of severe morbidity, including

bronchopulmonary dysplasia, intraventricular hemorrhage, periventricular leukomalacia, necrotizing enterocolitis, and infection. Within the higher-risk SGA population, we hypothesized that mortality rates would be higher than observed in appropriately grown infants, but decreased in those born to mothers with HTN, despite the association between maternal HTN and SGA. This dissertation begins with an explanation of current knowledge about preterm birth, maternal HTN, and their associations. Chapter 2 focuses on the relationship between maternal HTN and infant mortality in extremely preterm infants. Chapter 3 examines the risk associated with severe morbidities in surviving infants. In addition, we also use a combined morbidity risk assessment score which has previously been used to determine future risk of long term disability. In Chapter 4, SGA infants are separately evaluated for their risk of mortality and the association with maternal HTN. These analyses support the high mortality and morbidity rates seen in extremely preterm infants. Maternal HTN, after adjustment, results in reduced risk of both mortality and severe morbidities in infants compared to infants born to mothers with other underlying contributors to preterm birth. This suggests that clinical practices and parental counseling should reflect differing risk profiles in sub-populations of extremely preterm infants.

A better way to learn maternal and newborn nursing! This unique presentation provides tightly focused maternal-newborn coverage in a highly structured text

The definitive reference in the field--now significantly revised with 75% new material--this volume examines typical and atypical development from birth to the preschool years and identifies what works in helping children and families at risk. Foremost experts explore neurobiological, family, and sociocultural factors in infant mental health, with a major focus on primary caregiving relationships. Risk factors for developmental problems are analyzed, and current information on disorders and disabilities of early childhood is presented. The volume showcases evidence-based approaches to assessment and intervention and describes applications in mental health, primary care, child care, and child welfare settings. New to This Edition: \*Chapters on genetic and epigenetic processes, executive functions, historical trauma, and neglect. \*Chapters on additional clinical problems: hyperactivity and inattention, sensory overresponsivity, and relationship-specific disorder. \*Chapters on additional interventions: attachment and biobehavioral catch-up, video-feedback intervention to promote positive parenting and sensitive
