Principles of Concurrent and Distributed Programming provides an introduction to concurrent programming focusing on general principles and not on specific systems. Software today is inherently concurrent or distributed - from event-based GUI designs to operating and real-time systems to Internet applications.

He then identifies the aims of concurrent programming to provide for correctness and fairness of execution. Chapter 3 describes the notion of a critical section, and how to implement it. It does so through four different attempts, each improving on the next, before describing Dekker's algorithm.

ples of Concurrent Programming and the first edition of Principles of Concurrent and Distributed Programming. Several developments have made it advisable to write a new edition. Surprisingly, the main reason is not any revolution in the principles of this subject. While the superficial technology may change, basic concepts

Principles of Concurrent and Distributed Programming

This module is aimed at introducing the principles of concurrency theory (1, 2, 3) and demonstrating how these can be applied to design and implement distributed applications (4). Advanced concepts of Web services will be studied and placed in the perspective of these principles (5, 6). The following is an indicative list of topics: □ Message passing primitives for concurrency: synchronous versus asynchronous message passing, the actor model.

This book concentrates on principles and theory, providing an excellent background for concurrent programming. Readers expecting a tutorial on pthreads or win32 threads should look elsewhere. A calculus for reasoning about concurrent programming is presented, along with problems, solutions, and proofs for common concurrent programming concerns.

Concurrent programming consists of using programming constructs that are mapped in this way. Concurrent programming in the Java programming language entails using Java programming language constructs to this effect, as opposed to system-level constructs that are used to create new operating system processes.
