Programmable Logic Controllers –
Beginner

A programmable logic controller is a digitally operated electronic system. It is designed for use in an industrial environment. It uses a programmable memory for the internal storage of user oriented instructions for implementing specific functions such as logic sequencing, timing, counting and arithmetic to control etc.

Introduction to PLCs: A beginner's guide to Programmable ...

Programmable Logic Controllers continuously monitors the input values from various input sensing devices (e.g. accelerometer, weight scale, hardwired signals, etc.) and produces corresponding output depending on the nature of production and industry. A typical block diagram of PLC consists of five parts namely: Rack or chassis; Power Supply Module

Introduction to PLCs: A beginner's guide to Programmable ...
Programmable Logic Controllers (PLCs) are the major components in industrial automation and control systems. The controlling nature of PLC is ranging from simple- push button switching to a single motor to several complex control structures.

Manual
A controller is a system where one or more input quantities are recorded and processed internally by the system, thereby affecting various output quantities. Signals such as switching states are entered via control inputs, processed in the controller by a program and forwarded to outputs to be switched.

Programmable Logic Controllers Beginner's Manual

A programmable logic controller or programmable controller is an industrial digital computer which has been ruggedized and adapted for the control of manufacturing processes, such as assembly lines, or robotic devices, or any activity that requires high reliability, ease of programming and process fault diagnosis. PLCs can range from small modular devices with tens of inputs and outputs, in a housing integral with the processor, to large rack-mounted modular devices with a count of thousands of

Wikipedia

1.3 Basic design of a PLC The term 'programmable logic controller' is defined as follows by EN 61131-1 (IEC 61131-1): " A digitally operating electronic system, designed for use in an industrial environment, which uses a programmable memory for the internal storage of user-oriented instructions for implementing specific functions such as logic, sequencing, timing, counting and arithmetic, to control, through digital or analogue inputs and outputs, various types of machines or processes.
