The concept is called Adaptive Robust Control. It may be compared with Gain Scheduling, Two-Time Scale Adaptive Control, Intermittent Adaptive Control, Repeated Auto-Tuning, or Switched Adaptive Control, with the important difference that the control is switched between robust controllers that are based on plant uncertainty sets that take into account not only the currently estimated plant model set but also the possible jumps and drifts that may occur until the earliest next time the ...

Generally, robust adaptive control methods , , have gained more attention recently due to their agility and robustness. However, most of these papers employ model-based method; therefore, the plant should be modeled comprehensively which is usually a delicate task, particularly, when the plant is a robot with non-linear equations.

A robust adaptive variable structure output feedback controller to stabilize uncertain dynamics system with explicitly considering nonlinearity/dead-zone control in control input has been proposed. It is shown that the designed controller guarantees the global reaching condition of the sliding mode for the uncertain system.

Robust Adaptive Control of Feedback Linearizable MIMO Nonlinear Systems With Prescribed Performance. Abstract: A novel robust adaptive controller for multi-input multi-output (MIMO) feedback linearizable nonlinear systems possessing unknown nonlinearities, capable of guaranteeing a prescribed performance, is developed in this paper. By prescribed performance we mean that the tracking error should converge to an arbitrarily small residual set, with convergence rate no less than a prespecified ...

Robust Adaptive Control of Feedback Linearizable MIMO ...

Adaptive control is different from robust control in that it does not need a priori information about the bounds on these uncertain or time-varying parameters; robust control guarantees that if the changes are within given bounds the control law need not be changed, while adaptive control is concerned with control law changing itself.

Robust and Adaptive Control Control of underwater vehicles at low speed is challenging, as the authority of the control surfaces increases with the velocity squared, and thus at low speed the control surfaces are less effective.
