One of the most important subjects for any student of engineering or materials to master is the behaviour of materials and structures under load. The way in which they react to applied forces, the deflections resulting and the stresses and strains set up in the bodies concerned are all vital considerations when designing a mechanical component such that it will not fail under predicted load during its service lifetime. Building upon the fundamentals established in the introductory volume *Mechanics of Materials 1*, this book extends the scope of material covered into more complex areas such as unsymmetrical bending, loading and deflection of struts, rings, discs, cylinders plates, diaphragms and thin walled sections. There is a new treatment of the Finite Element Method of analysis, and more advanced topics such as contact and residual stresses, stress concentrations, fatigue, creep and fracture are also covered. Each chapter contains a summary of the essential formulae which are developed in the chapter, and a large number of worked examples which progress in level of difficulty as the principles are enlarged upon. In addition, each chapter concludes with an extensive selection of problems for solution by the student, mostly examination questions from professional and academic bodies, which are graded according to difficulty and furnished with answers at the end.

One of the most important subjects for any student of engineering to master is the behaviour of materials and structures under load. The way in which they react to applied forces, the deflections resulting and the stresses and strains set up in the bodies concerned are all vital considerations when designing a mechanical component such that it will not fail under predicted load during its service lifetime. All the essential elements of a treatment of these topics are contained within this course of study, starting with an introduction to the concepts of stress and strain, shear force and bending moments and moving on to the examination of bending, shear and torsion in elements such as beams, cylinders, shells and springs. A simple treatment of complex stress and complex strain leads to a study of the theories of elastic failure and an introduction to the experimental methods of stress and strain analysis. More advanced topics are dealt with in a companion volume - *Mechanics of Materials 2*. Each chapter contains a summary of the essential formulae which are developed in the chapter, and a large number of worked examples which progress in level of difficulty as the principles are enlarged upon. In addition, each chapter concludes with an extensive selection of problems for solution by the student, mostly examination questions from professional and academic bodies, which are graded according to difficulty and furnished with answers at the end.

- * Emphasis on practical learning and applications, rather than theory
- * Provides the essential formulae for each individual chapter
- * Contains numerous worked examples and problems

Polygonal modeling is the process of creating objects in a 3D environment. It is the foundation for the creation of all 3D graphics and the essential building block of a career in computer graphics. Polygonal Modeling: Basic and Advanced Techniques provides in-depth coverage of polygonal modeling, including practical lessons on topology construction, a focus on the fundamentals of subdivision workflow, and a discussion of the technical aspects of modeling organic and inorganic objects. The book includes illustrated quick start modeling guides to 3ds max and Maya. Explore and evaluate a variety of subdivision techniques. Learn about polygonal objects and their most common properties. Discover how to use the tools and operations found in major 3D packages for polygonal modeling. Follow along with the step-by-step illustrated exercises that demonstrate the process of character modeling.

The First African InterQuadrennial ICF Conference “ AIQ-ICF2008 ” on Damage and Fracture Mechanics – Failure Analysis of Engineering Materials and Structures ” , Algiers, Algeria, June 1 – 5, 2008 is the first in the series of InterQuadrennial Conferences on Fracture to be held in the continent of Africa. During the conference, African researchers have shown that they merit a strong reputation in international circles and continue to make substantial contributions to the field of fracture mechanics. As in most countries, the research effort in Africa is und- taken at the industrial, academic, private sector and governmental levels, and covers the whole spectrum of fracture and fatigue. The AIQ-ICF2008 has brought together researchers and engineers to review and discuss advances in the development of methods and approaches on Damage and Fracture Mechanics. By bringing together the leading international experts in the field, AIQ-ICF promotes technology transfer and provides a forum for industry and researchers of the host nation to present their accomplishments and to develop new ideas at the highest level. International Conferences have an important role to play in the technology transfer process, especially in terms of the relationships to be established between the participants and the informal exchange of ideas that this ICF offers.

In *News from Heaven*, Jennifer Haigh—bestselling author of *Faith* and *The Condition*—returns to the territory of her acclaimed novel *Baker Towers* with a collection of short stories set in and around the fictionalized coal-mining town of Bakerton, Pennsylvania. Exploring themes of restlessness, regret, redemption and acceptance, Jennifer Haigh depicts men and women of different generations shaped by dreams and haunted by disappointments. Janet Maslin of the *New York Times* has called Haigh's Bakerton stories "utterly, entrancingly alive on the page," comparable to Richard Russo's *Empire Falls*.
