Valve Timing Diagram The above processes will be operated with the sequence of operations of the valves in the Four-stroke engine. This relation between the valve opening timings to the piston moves from the Top Dead Centre (TDC) to the Bottom Dead Centre (BDC) can be represented on a circle. This is called the Valve Timing Diagram.

Valve Timing Diagram for 4-Stroke Engine (petrol and diesel) As we all know in 4-stroke engine the cycle completes in 4-strokes that are suction, compression, expansion and exhaust . The relation between the valves (inlet and outlet) and piston movement from TDC to BDC is represented by the graph known as valve timing diagram. Theoretical

Valve timing is the regulation put on the engine valves, how they set to open and close during working cycle. The diagram shows the timing of opening and closing of intake and exhaust valve during one complete cycle of four strokes. The valve timing is one of the important factors that affect the volumetric efficiency of the engine.

The theoretical valve timing diagram for a four-stroke cycle engine is shown in this diagram, the inlet valve opens at A and the suction takes place from A to B. The crankshaft revolves through 180° and the piston moves from T.D.C. to B.D.C. At B, the inlet valve closes and the compression takes place from B to C.

Valve timing diagram shows the opening and closing of inlet and exhaust valve according to the 4 strokes of engines or we can simply say according to the two revolution of crankshaft. It is clearly shown in the diagram that inlet valve opens 25 degree before TDC ( Top dead center - top edge of the cylinder) and inlet valve closes after suction stage ends i.e 30 degree after BDC.
